

## **AMENDMENTS**

### **In the Specification:**

Page 4, lines 22-37, amend the paragraph as follows:

The prostheses intended for the more cranial intervertebral spaces (in particular C2/C3 and C3/C4) are distinguished on the one hand by a ~~smaller~~ larger hinge radius than in the prostheses which are intended for the more caudal intervertebral spaces (in particular C5/C6 and C6/C7). On the other hand, the prostheses to be fitted more in the cranial direction can have a smaller surface extent in particular in the AP direction (AP = anteroposterior) than the prostheses to be fitted in the more caudal direction can. Thus, a further characteristic feature of the invention lies in the fact that the set of intervertebral prostheses comprises at least one first prosthesis whose hinge radius is greater and whose surface extent (in particular in the AP direction) is smaller than those of a second prosthesis.
